optoNCDT ILR // Laser-optical distance sensors

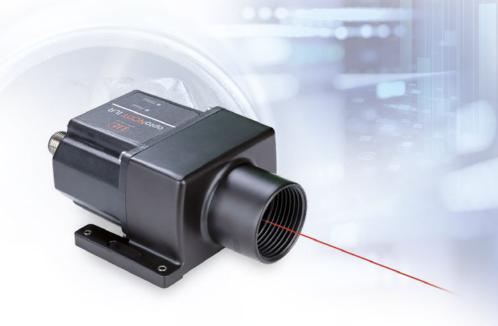

High-performance laser distance sensor for industrial applications

optoNCDT ILR3800-100

heating for outdoor applications

With the optoNCDT ILR3800-100, Micro-Epsilon presents a new powerful laser distance sensor. The sensor is designed for operation with or without reflector film, which is used depending on the distance and ambient conditions.

The sensor measures large distances up to 100 m without contact and provides best results even on challenging (dark, structured or weakly reflecting) surfaces. The measuring range can be extended up to 150 m by attaching a reflector film to the measuring object.

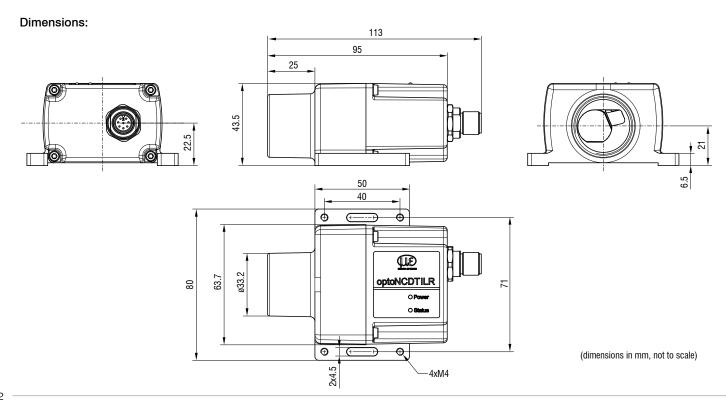

Thanks to the integrated AUTO measuring mode, even dark, partially reflective and distant targets can be detected precisely and reliably. A simple and fast alignment of the sensor is made possible by the integrated mounting plate with 4 set screws.

The ILR3800-100 sensors provide reliable results even under harsh conditions. They are protected against dust and splash water thanks to the robust design in the IP67-certified aluminum housing.

Compact size combined with low weight opens up new fields of application particularly in factory and plant automation, as well as in drone applications for distance measurement from the air.

ILR3800-100-H with integrated heating

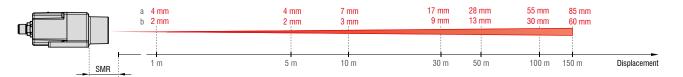

The ILR3800-100-H option has an integrated heating and cooling element that enables operation in the temperature range of -40 to \pm 55 °C. This allows the sensors to be used permanently outdoors.

Oval light spot diameter

The ILR3800-100 sensor works with a semiconductor laser at a wavelength of 655 nm (visible/red). Laser power is <1 mW. The sensors fall within laser class 2. Devices of this laser class require no special safety precautions.

Reflector film

The sensor measures the distance to moving and stationary objects. The measurable distance can be increased by using a reflective film suitable for the sensor. However, the minimum distance from the sensor to the reflector film must be maintained. The center of the laser spot must be in the center of the reflector over the entire measuring range. Target (reflector) and sensor can only be tilted by at most 5° relative to one another.

Air purge collar

A compressed-air purge collar reliably prevents the deposition of dust and particles on the lens surface, ensuring that the optical performance remains consistently high. In addition, this reduces the cleaning effort and extends the service life of the system.
